

This diagram illustrates the complete mineral processing workflow, from extraction at the open pit to final product handling. The process begins with ore extraction and transport to the stockpile, followed by primary crushing and grinding in SAG and Verti Mills. The resulting slurry is classified through a series of rougher and cleaner stages. The final concentrate is thickened and filtered, while the tailings are thickened and stacked. The concentrate is then transported 80 kilometers to the Bing Bong Loading Facility for shipment via ship loader.
